Q.1. Solve the following : (Any 5)	
(i) $\Delta ABC \sim \Delta APQ$ [Given]	
$\therefore \frac{A(\Delta ABC)}{A(\Delta APQ)} = \frac{BC^2}{PQ^2}$ [Areas of similar triangles]	$\frac{1}{2}$
$\therefore \frac{1}{4} = \frac{BC^2}{PQ^2}$ [Given]	
$\therefore \frac{BC}{PQ} = \frac{1}{2}$ [Taking square roots]	$\frac{1}{2}$
(ii) Chords AB and CD intersect each other at point P outside the circle.	
$\therefore PA \times PB = PC \times PD$	$\frac{1}{2}$
$\therefore 6 \times 3 = PC \times 4$	
$\therefore PC = \frac{6 \times 3}{4}$	
$\therefore PC = \frac{9}{2}$	$\frac{1}{2}$
$\therefore PC = 4.5 \text{ units}$	
(iii) $\theta = -60^\circ$	
$\cos(-\theta) = \cos \theta$

$\therefore \cos(-60) = \frac{1}{2}$	$\frac{1}{2}$
$\operatorname{cosec}(-\theta) = -\operatorname{cosec} \theta$

	$\therefore \frac{BC}{EF} = \frac{6}{8}$ [Taking square roots]	
	\therefore $\frac{BC}{EF} = \frac{3}{4}$	$\frac{1}{2}$
(vi)	Radius of base of cone (r) = 7 cm Its height (h) = 24 cm $l^2 = r^2 + h^2$	$\frac{1}{2}$
	$\therefore l^2 = 7^2 + 24^2$	
	$\therefore l^2 = 49 + 576$	
	$\therefore l^2 = 625$	
	$\therefore l = 25$ [Taking square roots]

Let, $A \equiv (k, 3)$, $B \equiv (2, -4)$, $C \equiv (-k + 1, -2)$ \therefore Points A, B and C are collinear

Slope of line AB = Slope of line BC

$$\therefore \frac{-4 - 3}{2 - k} = \frac{-2 - (-4)}{(-k + 1) - 2}$$

$$\therefore \frac{-7}{2 - k} = \frac{-2 + 4}{-k + 1 - 2}$$

$$\therefore \frac{-7}{2 - k} = \frac{2}{-k - 1}$$

$$\therefore -7(-k - 1) = 2(2 - k)$$

$$\therefore 7k + 7 = 4 - 2k$$

$$\therefore 7k + 2k = 4 - 7$$

$$\therefore 9k = -3$$

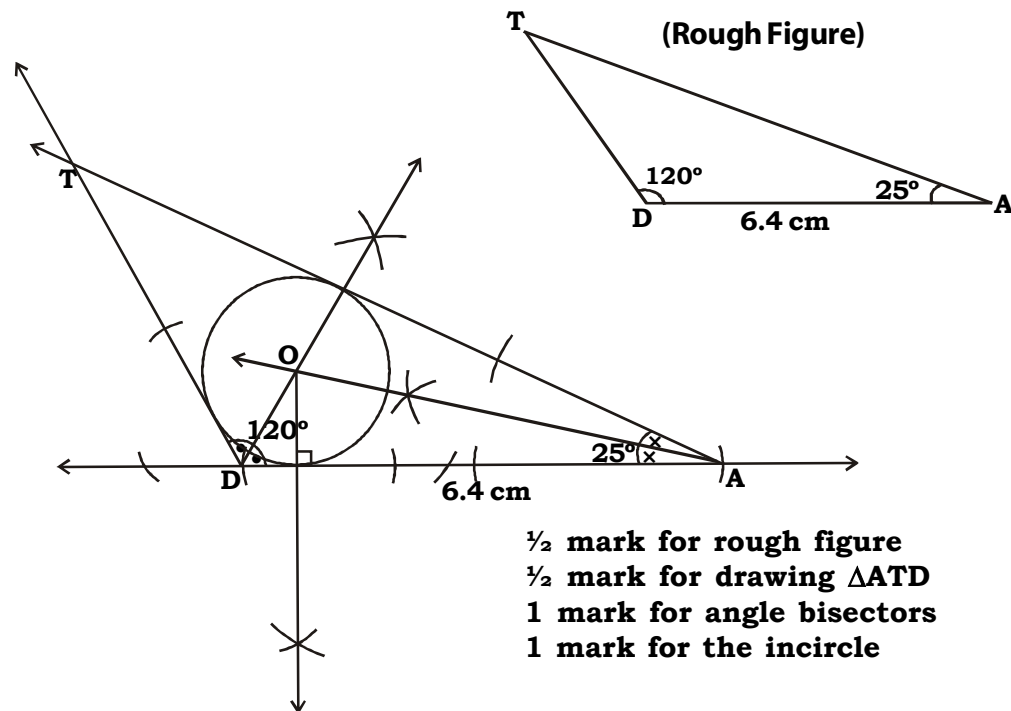

$$\therefore k = \frac{-3}{9}$$

$$\therefore k = \frac{-1}{3}$$

Q.4. Solve the following : (Any 2)

[½ mark for figure]

(i)

Given : □ABCD is a cyclic

To Prove : $m \angle ABC + m \angle ADC = 180^\circ$

$m \angle BAD + m \angle BCD = 180^\circ$

Proof: $m \angle ABC = \frac{1}{2} m (\text{arc ADC}) \dots\dots(i)$

$m \angle ADC = \frac{1}{2} m (\text{arc ABC}) \dots\dots(ii)$

[Inscribed angle theorem]

Adding (i) and (ii), we get

$$m \angle ABC + m \angle ADC = \frac{1}{2} m (\text{arc ADC}) + \frac{1}{2} m (\text{arc ABC})$$

$$\therefore m \angle ABC + m \angle ADC = \frac{1}{2} [m (\text{arc ADC}) + m (\text{arc ABC})]$$

$$\therefore m \angle ABC + m \angle ADC = \frac{1}{2} \times 360^\circ [\because \text{Measure of a circle is } 360^\circ]$$

$$\therefore m \angle ABC + m \angle ADC = 180^\circ \dots\dots\dots(iii)$$

In □ABCD,

$$m \angle BAD + m \angle BCD + m \angle ABC + m \angle ADC = 360^\circ$$

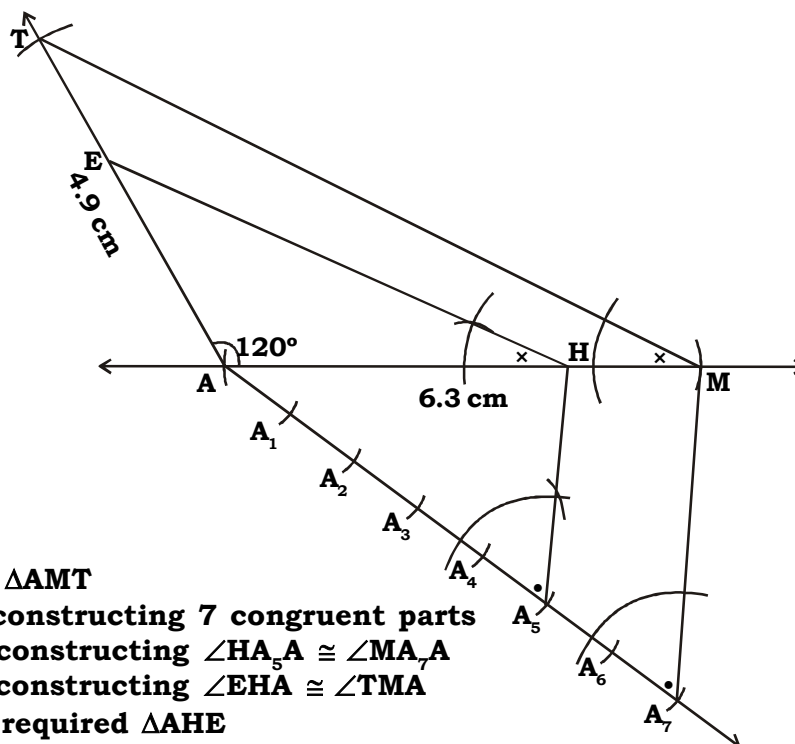

[∵ Sum of measure of angles of a quadrilateral is 360°]

$$\therefore m \angle BAD + m \angle BCD + 180^\circ = 360^\circ \quad [\text{From (iii)}]$$

$$\therefore m \angle BAD + m \angle BCD = 180^\circ$$
